A;Description: EC 4.1.1.41 [validated, MUID:98088990]
A;Note: specific activity up to 25 U/mg protein; Km value for (S)-methylmalonyl-CoA C;Superfamily: biotin carboxyl carrier protein; lipoyl/biotin-binding homology C;Keywords: carbon-carbon lyase; carboxy-lyase
                                                                                                                                                                                                                                                                                                            A;Cross-references: UNIPROT:054030; EMBL:AJ002015; NID:g2706397; PIDN:CAA05139.1; PID:g2A;Experimental source: DSM 2376
C;Comment: Methylmalonyl-CoA decarboxylase catalyses the only energy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                R;Bott, M.; Pfister, K.; Burda, P.; Kalbermatter, O.; Woehlke, G.; Dimroth, P. IT "DEDD and DEDD2 associate with caspase-8/10 and signal cell death.";

Concogene 22:291-297(2003).

Could be and may target Caspb and Caspio to the nucleus. May regulate degradation of intermediate filaments during apoptosis. The supplies and may target caspb and caspion machinery in the nucleus and might be an important regulator of the activity of Courses.

Courses and might be an important regulator of the activity of Courses.

Courses and heterodimerizes with DEDD.

c. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002)
the tumor cell lines chronic myologenous leukemia K-562 and the colorectal adenocarcinoma SW480. Expression is moderate in the cervical carcinoma HeLa, the Burkitt's lymphoma Raji, the lung carcinoma A549, and the melonoma G361. In contrast, two leukemia cell lines, HL-60 (promyelocytic leukemia) and MOIT-4 (lymphoblastic leukemia), show relatively low levels
                                                                                                                                                                                  TISSUE SPECIFICITY: Expressed In most tissues. High levels were found in liver, kidney, heart, ovary, spleen, testes, skeletal muscle and peripheral blood leukocytes. Expression was absent or low in colon and small intestine. Expression is relatively high i

RT Generation and initial analysis of more than 15,000 full-length human
RT and mouse cDNA sequences.";
Proc. Natl. Acad. Sci. U.S.A., 99:16899-16903(2002).
CC apoptosis and may target CASP8 and CASP10 to the nucleus. May
CC regulate degradation of intermediate filaments during apoptosis.
CC May play a role in the general transcription machinery in the
nucleus and might be an important regulator of the activity of
CC GTF3C3.
C1- SUBCDITI: Interacts with CASP8, CASP10 and GTF3C3. Homodimerizes
CC and heterodimerizes with DEDD (By similarity).
C1- SUBCELLULAR LOCATION: Nuclear, accumulated in subnuclear

Note=No experimental confirmation available;
TISSUE SPECIFICITY: Expression is high in liver, heart, and testis but low in brain, spleen, lung, and skeleton DOWAIN: Interactions with CASPB and CASP10 are mediated domain (By similarity).

SIMILARITY: Contains 1 death effector (DED) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Event=Alternative

                                                                                                                                                                                                                                                                                                                                                                                substrates and facilitates their ordered degradation during apoptosis. May also play a role in mediating CASP3 cleavage of KRT18. Regulates degradation of intermediate filaments during apoptosis. May play a role in the general transcription machinery in the nucleus and might be an important regulator of the activity of GTF3C3. Inhibits DNA transcription in vitro (By similarity).

-I. SUBUNIT: Interacts with CASP8, CASP10, KRT18, KRT18, CASP3 and FADD. Homodimerizes and heterodimerizes with DEDD2.

-I. SUBCELLULAR LOCATION: Cytoplasmic. Translocated to the nucleus during CD95-mediated apoptosis where it is localized in the nucleoli (By similarity). Following apoptosis induction, the mono and/or diubiquitination form increases and forms filamentous structures that colocalize with KTE8 and KRT18 intermediate filament network in simple epithelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            "Death effector domain-containing proteins DEDD and FLAME-3 form nuclear complexes with the TFIIIC102 subunit of human transcription factor IIIC.";

Translocated to the nucleus during CD95-mediated apoptosis where it is localized in the nucleoli. Following apoptosis induction, the mono and/or diubiquitination form increases and forms filamentous structures that colocalize with KRT8 and KRT18 intermediate filament network in simple epithelial cells (By similarity). TISSUE SPECIFICITY: Ubiquitously expressed. PTM: Exists predominantly in a mono- or diubiquitinated form. SIMILARITY: Contains 1 death effector (DED) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              substrates and facilitates their ordered degradation during apoptosis. May also play a role in mediating CASP3 cleavage of KRT18. Regulates degradation of intermediate filaments during apoptosis. May play a role in the general transcription machinery in the nucleus and might be an important regulator of the activity of GTF3C3 (By similarity). Inhibits DNA transcription in vitro. SUBUNIT: Interacts with CASP8, CASP10, KRT8, KRT18, CASP3 and FADD. Homodimerizes and heterodimerizes with DEDD2 (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             mouse cDNA sequences.";

                                                                           that colocalize with KRT8 and KRT18 intermediate filament in simple epithelial cells (By similarity).

TISSUE SPECIFICITY: Widely expressed with highest levels i testis. Within the testis, highly expressed in germ cells expressed in Sertoli cells.

DEVELOPMENTAL STAGE: First detected in 20-day-old animals.
                                                                                                                                                                                                                                                                                                                                        C.P., Hsu S.Y., McGee E.A., Salanova M., Hsueh A.J.W.
FT, a novel death effector domain-containing molecule
                                         FIM: EXISTS predominantly SIMILARITY: Contains 1 dea
                                                                                                                                                SUBCELLULAR LOCATION: Cytoplasmic. Translocated to the nucleus during CD95-mediated apoptosis where it is localized in the nucleoli. Following apoptosis induction, the mono and/or diubiquitination form increases and forms filamentous structures
                                                                  a peak at 30 days.
